## PARTITIONING POINT SETS IN ARBITRARY DIMENSION (CLASSIC REPRINT) (PAPERBACK)

Forgotten Books, United States, 2015. Paperback. Condition: New. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*. Excerpt from Partitioning Point Sets in Arbitrary Dimension 1. Introduction The half-space retrieval problem is the following. Given a set of  $n$  points in  $d$  dimensional Euclidean space, preprocess them so as to be able to quickly answer the query; how many points lie in the query half space  $H$ . (A variant of the problem, the listing problem, is to ask for a list of the points in the half space.) It is assumed that many such queries will be made. Thus it is reasonable to preprocess the set of points and to amortize the cost of this preprocessing over the (many) queries. Our first concern here is with the query time and the space used by the data structure for holding the preprocessed information. We note that the naive searching algorithm takes linear time. Thus, we aim for a sublinear search time and a data structure using linear space. A second concern is to find relatively efficient algorithms for building the data structures. Recently, an elegant approach to this problem was discovered by Willard [ ]. There are two basic lemmas underlying his construction. First, given a set of  $n$  points, the plane can be partitioned by two straight lines into 4 quadrants, so that each (open) quadrant holds at most  $n/4$  points. This leads to a recursive storage of the points in a 4-way balanced tree (ignoring, for now, points lying on the partitioning lines). Second, any line intersects only 3 of the 4 quadrants defined by the two partitioning lines. This implies that in carrying out a half-space query at most three of the four subtrees of the root need be explored further. Recursive application of this observation...
